

2016 Ohio Drug Overdose Data: General Findings

Fentanyl and Related Drugs Like Carfentanil as well as Cocaine Drove Increase in Overdose Deaths

Ohio's opioid epidemic continued to evolve in 2016 to stronger drugs, driving an increase in unintentional overdose deaths. The data shows a significant increase in overdose deaths involving the opioid fentanyl, the emergence of more powerful fentanyl-related drugs like carfentanil, and indications that cocaine was used with fentanyl and other opiates. The data also shows some promising progress – the fewest unintentional overdose deaths involving prescription opioids since 2009 (excluding deaths involving fentanyl and related drugs).

Illegally produced fentanyl can be hundreds of times stronger than heroin, and carfentanil and other related drugs can be stronger than fentanyl.

In 2016, unintentional drug overdoses caused the deaths of 4,050 Ohio residents, a 32.8 percent increase compared to 2015 when there were 3,050 overdose deaths.

Fentanyl and related drugs were involved in 58.2 percent (2,357) of all unintentional drug overdose deaths in 2016. By comparison, fentanyl was involved in 37.9 percent (1,155) in 2015, 19.9 percent (503) in 2014, 4.0 percent (84) in 2013, and 3.9 percent (75) in 2012 (see Figures 1 and 2). With the emergence of carfentanil in 2016, the fentanyl-related drug was involved in 340 overdose deaths, most of them during the second half of the year. For males and females respectively, the largest number of fentanyl and related drug overdose deaths were among the 25-34 age group. (see Figure 3). The increase in fentanyl and carfentanil overdose deaths in 2016 corresponded with an increase in drug seizure reports by law enforcement (see Figure 4).

The number of cocaine-related overdose deaths rose significantly from 685 in 2015 to 1,109 in 2016 — a 61.9 percent increase (see Table 1). Of cocaine-related overdose deaths in 2016, 80.2 percent also involved an opiate, and 55.8 percent involved fentanyl and related opiates in particular.

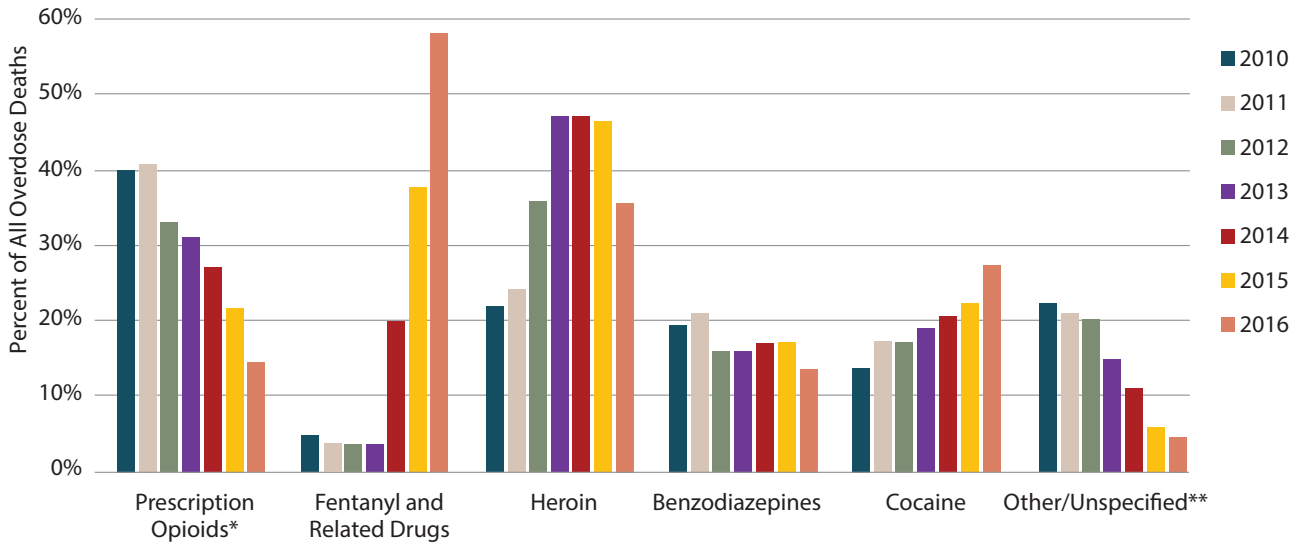

The number of overdose deaths involving heroin remained relatively flat with 1,444 overdose deaths in 2016 compared to 1,424 in 2015 (see Table 1).

Figure 1. Number of Fentanyl and Related Drug Deaths and Percentage of Unintentional Overdose Deaths, by Year, Ohio, 2012-2016

Source: Ohio Department of Health, Bureau of Vital Statistics; analysis conducted by ODH Violence and Injury Prevention Program. Includes Ohio residents who died due to unintentional drug poisoning (underlying cause of death ICD-10 codes X40-X44).

Figure 2. Percentage of Unintentional Drug Overdose Deaths Involving Selected Drugs, by Year, 2010-2016

Source: Ohio Department of Health, Bureau of Vital Statistics; analysis conducted by ODH Violence and Injury Prevention Program.
 Includes Ohio residents who died due to unintentional drug poisoning (underlying cause of death ICD-10 codes X40-X44).
 * Excludes deaths involving fentanyl and related drugs.
 ** No specific drug was identified.

Source: Ohio Department of Health, Bureau of Vital Statistics; analysis conducted by ODH Violence and Injury Prevention Program.
 Includes Ohio residents who died due to unintentional drug poisoning (underlying cause of death ICD-10 codes X40-X44).

Figure 4. Number of Fentanyl-Related Deaths and Reported Drug Seizures, Ohio, 2014-2016

Source: National Forensic Laboratory Information System provided by the State of Ohio Board of Pharmacy (data accessed 8-22-2017) and Ohio Department of Health, Bureau of Vital Statistics; analysis conducted by ODH Violence and Injury Prevention Program. Includes Ohio residents who died due to unintentional drug poisoning (underlying cause of death ICD-10 codes X40-X44).

Unintentional Overdose Deaths Involving Prescription Opioids Continued to Decline

Combating prescription opioid abuse is important because prescription opioids are involved in a significant number of overdose deaths in Ohio, and abuse of them is a key risk factor for heroin and fentanyl use, according to the Centers for Disease Control and Prevention (CDC). Of all unintentional overdose deaths in Ohio in 2016, 834 (20.6 percent) had an opioid prescription in the previous 30 days.

Still, of all unintentional drug overdose deaths, the percentage of prescription opioid-related deaths in Ohio declined for a fifth straight year in 2016 (excluding deaths involving fentanyl and related drugs), and the number of these deaths declined 15.4 percent from 667 in 2015 to 564 in 2016 — the fewest since 2009 (see Figure 2 and Table 1).

This decline corresponded with Ohio’s efforts to reduce the prescription opioid supply available for diversion and abuse through law enforcement efforts, working with medical professionals to establish [opioid prescribing guidelines](#), and empowering prescribers and pharmacists to prevent opioid abuse using Ohio’s prescription drug monitoring program, the [Ohio Automated Rx Reporting System \(OARRS\)](#). Doctors and other prescribers are required to check OARRS before prescribing an opioid or benzodiazepine to see what controlled substance medications a patient might already be taking. A May 2016 fact sheet from the American Medical Association showed that Ohio led the nation in prescription drug monitoring in 2016 when OARRS received more than 24 million queries from Ohio prescribers — far more than any other state. The number of OARRS queries in Ohio increased from 1.8 million in 2011 to 24.1 million in 2016 (see Figure 5).

Opioid prescribing in Ohio declined for a fourth consecutive year in 2016, according to the State of Ohio Board of Pharmacy (see Figure 6). Between 2012 and 2016, the total number of opioids dispensed to Ohio patients decreased by 162 million doses or 20.4 percent.

Unintentional Overdoses Involving Select Drugs and Age-Adjusted Death Rate

Figure 7. Number of Unintentional Drug Overdose Deaths Involving Selected Drugs, by Year, Ohio, 2000-2016

Source: Ohio Department of Health, Bureau of Vital Statistics; analysis conducted by ODH Violence and Injury Prevention Program. Multiple drugs are usually involved in overdose deaths. Individual deaths may be reported in more than one category. Includes Ohio residents who died due to unintentional drug poisoning (underlying cause of death ICD-10 codes X40-X44). * Excludes deaths involving fentanyl and related drugs.

Figure 8. Number of Deaths and Annual Age-Adjusted Death Rate* per 100,000 Population from Unintentional Drug Overdose by Year, Ohio Residents, 2000-2016

Source: Ohio Department of Health, Bureau of Vital Statistics; analysis conducted by ODH Violence and Injury Prevention Program. *The death rate is presented as age-adjusted which allows a comparison of death rates between populations (e.g. counties and states). The rates are adjusted to the U.S. 2000 standard population to allow a comparison of the overall risk of dying between different populations.

Source: Ohio Department of Health, Bureau of Vital Statistics; analysis conducted by ODH Violence and Injury Prevention Program.

Includes Ohio residents who died due to unintentional drug poisoning (underlying cause of death ICD-10 codes X40-X44).

1. Total includes out of state deaths of Ohio residents for all years.

2. Individual drugs do not add up to totals as more than one drug may be listed on the death certificate for one death.

3. Data completeness varies from year to year for residents who died out of state; approximately 2 percent of the fatal overdoses on average each year.

[^] Data restated to incorporate coroner supplemental records not previously reflected in ODH Public Health Data Warehouse data for indicated years.

* Includes prescription opioids, fentanyl and heroin.

** Excludes deaths involving fentanyl and related drugs; fentanyl was not captured in the data prior to 2007.

*** Alcohol was present along with other drugs; alcohol is considered a non-drug poisoning in ICD 10 coded mortality data and is not included in total unintentional drug overdose deaths.

**** Includes methamphetamines and other psychostimulants with potential for abuse (ICD-10 code T43.6).

***** Includes only those instances where no other drug than T50.9 (other/unspecified) is included as contributing to death.

¹Table includes Ohio residents who died due to unintentional drug poisoning (underlying cause of death ICD-10 codes X40-X44).

²Sources: Ohio Department of Health, Bureau of Vital Statistics; analysis conducted by ODH Violence and Injury Prevention Program; U.S. Census Bureau (Vintage 2016 population estimates).

³County is based on county of residence; beginning in 2015 the residence county value was derived from the geocoded county value based on the decedent's residence street address when the geocode was considered of high quality.

*Rate suppressed when fewer than 10 total deaths for 2011-2016.
